Become aware of the need	Find and configure the service	Submit, approve, fulfil and communicate	Validate and gain acceptance	Launch, monitor and improve

JOURNEY DIMENSION	1. Need Identified	2. Service Discovery	3. Request Configuration	4. Submit & Validate	5. Approval & Governance	6. Network Fulfilment	7. Notifications & Status	8. Testing & Validation	9. UAT & Acceptance	10. Production Launch	11. Monitor, Support & Improve
STEPS / EXPERIENCE	A network service is needed for work, access, connectivity, or a change.	The requester enters the Service Portal and explores network services.	The requester selects a catalog item and begins providing request details.	The requester reviews and submits the request; the platform validates data.	The request is routed through the required approval chain.	Approved work is converted into actionable fulfilment tasks.	The requester receives updates while the request moves through its lifecycle.	The configured journey is tested before release or after a change.	Business and operational stakeholders validate the experience against real scenarios.	Approved configuration is promoted from development toward production.	The live service is monitored, supported, reviewed, and continuously improved.
INTERACTIONS Things • Places • People	Things: Service Portal / browser Places: Employee workspace People: Requester, service owner	Things: Service Catalog, search, category navigation Places: Service Portal People: Requester, IT service owner	Things: Catalog item, variables, dynamic fields, help text Places: Service Portal People: Requester, IT admin	Things: Validation rules, confirmation, request record Places: Service Portal / platform People: Requester, system automation	Things: Approval record, Flow Designer, email Places: Platform / approver workspace People: Manager, Network Security / designated approver	Things: Fulfilment task, task context, assignment data Places: Network operations workspace People: Network Fulfilment Team, IT admin	Things: Email, portal status, request timeline Places: Inbox / Service Portal People: Requester, fulfilment team, approver	Things: Test scripts, logs, test records Places: Dev / test environment People: Developer, tester, service owner	Things: UAT scenarios, evidence, acceptance record Places: UAT environment / stakeholder review People: Requester representatives, approvers, fulfilment team, IT admin	Things: Deployment checklist, update set / migration package, training material Places: Production environment People: IT admin, release owner, support team	Things: Metrics, dashboards, feedback, audit data Places: Production / support channels People: Support, IT admin, service owner, users
GOALS & MOTIVATIONS	Employee / team identifies a network need and considers whether a request is required.	Service Portal → Service Catalog → Network Services category.	Catalog item form; variables; dynamic show/hide behaviour.	Submit action → validation → request/record creation.	Flow Designer approval logic; manager/security approver; email notifications; audit trail.	Flow Designer → fulfilment task → Network Fulfilment Team.	Email notifications; portal status; request/approval/task updates.	Unit tests; end-to-end simulations; approval/task/notification checks; data validation.	Stakeholder UAT; representative request scenarios; acceptance criteria.	Deployment checklist; Dev → Prod migration; release/change controls; training.	Platform monitoring; request metrics; support channels; feedback; audit/reporting.
POSITIVE MOMENTS	The need is recognized with a clear starting point.	The right service is easy to discover.	The form feels relevant and guided.	Submission succeeds with immediate confirmation.	Approval ownership is clear and traceable.	The fulfilment team receives complete, actionable context.	The requester can see progress without chasing.	Defects are found before production impact.	Stakeholders can validate realistic scenarios.	Launch is controlled and prepared.	The service becomes measurable and improvable.
NEGATIVE MOMENTS	Clear entry point and understandable service purpose.	Relevant catalog category and concise service descriptions.	Only relevant fields are shown; mandatory information is obvious.	Immediate validation and a clear confirmation/reference number.	Correct approver receives a structured request with traceable decision history.	Clear task ownership, complete request data, and standardized execution.	Timely, meaningful updates reduce follow-up calls and uncertainty.	Defects are identified early and corrected systematically.	Stakeholders can validate the complete experience, not just individual components.	Controlled migration, prepared users, and a clear rollback/support plan.	Issues are visible, measurable, and converted into improvement actions.
AREAS OF OPPORTUNITY	Uncertainty about the correct request path or terminology.	Too many choices or unclear categories can cause wrong selections.	Long forms, unclear fields, or missing guidance create rework.	Incomplete or inconsistent data can trigger clarification and delay.	Approval ambiguity, missed notifications, or manual routing can delay fulfilment.	Manual handoffs, unclear ownership, or incomplete data can cause rework.	Silence or overly technical messages make status difficult to understand.	Uncovered edge cases can create failures after release.	Late feedback or unclear acceptance criteria can extend delivery time.	Configuration gaps or unprepared teams can create launch friction.	Untracked defects, weak metrics, or feedback gaps can hide recurring problems.

ENHANCED JOURNEY INTELLIGENCE

The reference map is extended with a backstage ServiceNow layer and measurable journey outcomes so the customer experience can be connected directly to platform configuration and delivery.

JOURNEY STAGE	BACKSTAGE SERVICENOW EXPERIENCE	PRIMARY OWNER / HANDOFF	SUCCESS SIGNAL
1. Need Identified	Catalog taxonomy and request entry are prepared.	Requester / Service Owner	Correct entry point is discoverable.
2. Service Discovery	Catalog item content and taxonomy guide correct service selection.	Requester / IT Service Owner	Correct catalog item selected.
3. Request Configuration	Variable design creates structured data for automation.	Requester / IT Admin	Required data captured with minimal friction.
4. Submit & Validate	Validation protects downstream workflow quality.	Requester / Platform Automation	Valid request created without rework.
5. Approval & Governance	Flow Designer evaluates approval rules and records decisions.	Approver / IT Admin	Decision recorded with audit evidence.
6. Network Fulfilment	Automation creates/assigns fulfilment work with request context.	Network Fulfilment Team	Task completed with clear ownership.
7. Notifications & Status	Notifications communicate state changes based on lifecycle events.	Requester / Support	Status and notifications are timely.
8. Testing & Validation	Test evidence confirms catalog, approvals, tasks, notifications, and data accuracy.	Developer / Tester / Service Owner	Critical paths pass defined tests.
9. UAT & Acceptance	UAT feedback becomes controlled changes before production.	Stakeholder UAT Group	Acceptance criteria are satisfied.
10. Production Launch	Configuration is migrated and production behaviour is verified.	IT Admin / Release Owner	Production validation succeeds.
11. Monitor, Support & Improve	Operational data and feedback feed continuous improvement.	Support / Service Owner	Trend data drives improvement.

JOURNEY-TO-DESIGN BRIDGE

Customer experience	Simple discovery → guided form → transparent approval → predictable fulfilment → visible status → trusted closure.
ServiceNow design	Service Catalog + Variables + Dynamic Behaviours + Validation + Flow Designer + Approvals + Tasks + Notifications + Audit.
Delivery lifecycle	Design → Configure → Unit Test → End-to-End Test → UAT → Deploy → Monitor → Improve.
Evidence to capture	Request data accuracy, approval routing, task creation, notification delivery, defect results, UAT evidence, production validation, operational metrics.

MAP OUTCOME

The journey is designed as a continuous ServiceNow experience rather than a collection of isolated configuration steps. Each customer-facing moment has a corresponding platform behaviour, ownership handoff, and opportunity for measurable improvement.

Reference alignment: the uploaded example uses a journey-board structure built around Steps, Interactions, Goals & Motivations, Positive Moments, Negative Moments, Areas of Opportunity, and an Enter/Engage/Exit/Extend progression. This document keeps that underlying logic while adapting and extending it for the Automated Network Request Management project.
