PROJECT DEVELOPMENT PHASE

Model Performance Test

Date	14 October 2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Model Performance Testing

The current Automated Network Request Management solution does not implement an Artificial Intelligence, Machine Learning, or Generative AI model. It uses ServiceNow configuration, Flow Designer automation, approval logic, custom-table storage, UI Policies, Catalog Client Scripts where required, ACLs, notifications, and request lifecycle processing. Therefore, model-training metrics are not applicable and are recorded transparently as N/A rather than invented.

S.No.	Parameter	Values / Screenshot / Evidence
1	**Model Summary**	Not Applicable. No Artificial Intelligence, Machine Learning, or Generative AI model is implemented in the current solution. The project is rule-based and workflow-driven inside ServiceNow using Service Catalog, Flow Designer, approval logic, custom-table storage, UI Policies, Catalog Client Scripts where required, ACLs, notifications, and request lifecycle processing. Evidence: ServiceNow architecture / Flow Designer implementation evidence
2	**Accuracy**	Training Accuracy: N/A Validation Accuracy: N/A Reason: No trained predictive model is used. Current behaviour is evaluated through workflow, field mapping, approval, notification, and request-lifecycle testing rather than model accuracy metrics. Evidence: Functional / end-to-end testing evidence
3	**Fine Tuning Result (if done)**	N/A. No model fine-tuning or prompt/model training was performed because the current project does not contain an AI/GenAI model. Evidence: Not Applicable

Current Performance Validation Approach

• Catalog validation: confirm required Network Request variables are captured correctly.

• Variable mapping validation: verify Flow Designer retrieves catalog variables and maps them to Database Tables (u_database_tables).

• Approval validation: verify the configured approval action and Approved / Rejected branching.

• Notification validation: verify request-created and request-resolved emails.

• Lifecycle validation: verify REQ/RITM status and fulfilment stages.

• Security validation: verify Create, Read, Write and Delete ACL behaviour.

• Execution validation: use Flow Execution Details and platform logs to inspect failures, conditions, inputs, outputs, and record updates.

Conclusion

Because the current project is a ServiceNow workflow automation solution rather than an AI model, training accuracy, validation accuracy, and fine-tuning metrics are N/A. Project performance should instead be demonstrated through functional, integration, security, notification, approval, and end-to-end workflow tests.
