Acceptance Testing

UAT Execution & Report Submission

Date	14 October 2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

1. Purpose of Document

The purpose of this document is to summarize the User Acceptance Testing (UAT) coverage, defect status, and final test-case results for the Automated Network Request Management in ServiceNow project at the point of release readiness. The report focuses on the Network Request catalog form, catalog-variable processing, Flow Designer automation, operational-record mapping, approval handling, request tracking, notifications, and role/ACL-based access.

2. Defect Analysis

The UAT execution identified configuration and validation issues during development of the implemented workflow. The issues listed below were addressed and revalidated within the project testing cycle. Severity levels are normalized as Severity 1 = High, Severity 2 = Medium, Severity 3 = Low, and Severity 4 = Informational.

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	0	0	0	0	0
Duplicate	0	0	0	0	0
External	0	0	0	0	0
Fixed	0	3	2	0	5
Not Reproduced	0	0	0	0	0
Skipped	0	0	0	0	0
Won't Fix	0	0	0	0	0
Totals	0	3	2	0	5

Bug ID	Issue	Severity	Resolution
BG-001	Approval/approver visibility required configuration validation for the operational request record.	Medium	Approval Request relationship and approval configuration were validated against the Database Tables record.
BG-002	Catalog variables required correction/verification of mappings to the configured operational table.	Medium	Variable retrieval and field mappings were corrected and verified.
BG-003	Flow Designer execution paths required validation during workflow configuration.	Medium	Execution Details were used to locate action/condition issues and validate the corrected path.
BG-004	UI visibility behaviour required portal/form-specific adjustment.	Low	Catalog UI Policy behaviour was tested and adjusted.
BG-005	Request lifecycle/status progression required end-to-end validation across REQ/RITM and approval stages.	Low	Lifecycle evidence was reviewed from request creation through approval/fulfilment stages.

3. Test Case Analysis

The final UAT set contains twelve test cases covering the major functional areas of the current ServiceNow implementation. The documented UAT execution passed all twelve scenarios after configuration validation and correction of the identified issues.

Section	Total Cases	Not Tested	Fail	Pass
Catalog Form & Input Behaviour	2	0	0	2
Request / RITM Processing	2	0	0	2
Data Mapping & Storage	1	0	0	1
Approval & Workflow Processing	3	0	0	3
Notifications & Status Tracking	1	0	0	1
Security / Role Access	1	0	0	1
Approval Relationship	1	0	0	1
End-to-End Workflow	1	0	0	1
Totals	12	0	0	12

Test Case ID	Scenario	Expected Result	Final Result	Status
TC-001	Open Network Request catalog	Network Request form opens with required variables.	Form opened correctly with configured fields.	Pass
TC-002	Submit valid network request	REQ/RITM is created and workflow starts.	REQ0010014 / RITM0010018 evidence confirms request creation and workflow initiation.	Pass
TC-003	Validate dynamic form behaviour	Configured UI Policy shows/hides the relevant ID field correctly.	UI Policy behaviour was validated in the catalog form.	Pass
TC-004	Validate catalog variable retrieval	Configured variables are retrieved by Flow Designer.	Get Catalog Variables retrieves the configured request variables.	Pass
TC-005	Validate operational record	Required catalog values map to	Database Tables record mappings	Pass

Section	Total Cases	Not Tested	Fail	Pass
	mapping	correct operational fields.	were verified.	
TC-006	Validate approval processing	Approval is requested and result is available to the flow.	Ask for Approval and approval-status evaluation were verified.	Pass
TC-007	Validate approved branch	Approved result updates the record and reaches resolved notification action.	Approved branch updates Approval Status and triggers the resolved email action.	Pass
TC-008	Validate rejected branch	Rejected result updates the record and follows alternate handling.	Rejected branch updates Approval Status to Rejected and applies configured assignment handling.	Pass
TC-009	Validate request status tracking	Requester/authorized user can follow request progression.	RITM0010018 lifecycle stages were available for review.	Pass
TC-010	Validate role / ACL access	Access is restricted according to configured roles and ACLs.	Custom-table Create/Write/Read/Delete ACL configuration was verified.	Pass
TC-011	Validate approval relationship	Relevant approval records are visible for the current operational record.	Approval Request relationship filters by source table and document ID.	Pass
TC-012	Execute complete user journey	Submission → record creation → approval → decision → update → notification works end to end.	End-to-end workflow sequence was validated.	Pass

4. Release Readiness & Open Issues

No unresolved defects from the documented UAT set remain open. The current prototype is considered ready for demonstration / academic release of the implemented scope, subject to project owner or evaluator sign-off. External network-device/API automation, advanced analytics, AI/ML features, and external messaging integrations remain future enhancements and are not treated as current UAT defects.

5. UAT Conclusion & Sign-off

UAT result: PASS. The implemented network request workflow satisfied the documented acceptance scenarios after validation and correction of approval configuration, variable mapping, Flow Designer execution, UI behaviour, and request lifecycle handling.

Tester Name	_____
Test Completion Date	_____
Signature	_____
Final UAT Status	PASS
