User Acceptance Testing (UAT)

Automated Network Request Management in ServiceNow

Date	14 October 2026
Team ID	
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	

Project Overview

Project Name	Automated Network Request Management in ServiceNow
Project Description	A ServiceNow-based network request workflow that captures requester and service details through Service Catalog, creates the operational request record, routes the request for approval, updates the request based on the approval result, and communicates request status through automated notifications.
Project Version	Academic / Project Prototype
Testing Period	Project UAT cycle - final development/testing phase

Testing Scope

• Service Catalog Network Request form and catalog variables.

• Requester Information variable set and dynamic form behaviour through UI Policy.

• Request submission and REQ/RITM creation.

• Catalog variable retrieval and mapping into the configured Database Tables (u_database_tables) record.

• Flow Designer execution, approval routing, decision branching, and record updates.

• Request-created and approved/resolved email notification actions.

• Request lifecycle/status tracking from submission through approval and fulfilment stages.

• Roles and ACL-based access to the configured operational table.

• Approval Request relationship visibility between the operational record and approval records.

• End-to-end requester-to-approval-to-fulfilment workflow.

Testing Environment

URL/Location: ServiceNow Personal Developer Instance / Service Portal used for the project.

Credentials: Role-specific test accounts or authorized users as configured in the instance. Passwords are intentionally not included in documentation.

Test Cases

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
TC-001	Open Network Request catalog	Open Service Portal → Service Catalog → Networks and Connectivity → Network Request.	Network Request form opens with the configured variables.	Network Request form opened successfully with the configured fields.	Pass
TC-002	Valid network request submission	Enter valid requester, mobile, connection type, amount, payment mode, address and database/request details; submit.	Request is submitted and REQ/RITM records are created.	REQ0010014 / RITM0010018 evidence confirms request creation and workflow initiation.	Pass
TC-003	Dynamic form behaviour	Open the form and change the Type of Connection selection.	The configured UI Policy shows/hides the relevant ID field according to the configured condition.	Catalog UI Policy behaviour was configured and validated in the form.	Pass
TC-004	Catalog variable retrieval	Submit a Network Request and inspect the Flow Designer Get Catalog Variables action.	Configured request variables are retrieved for workflow processing.	Flow retrieves request_number, database_number, address, mode_of_payment, total_amount, mobile_number, type_of_connection and requested_for.	Pass
TC-005	Operational record mapping	Compare submitted catalog values with the created Database Tables record.	Required values map to the corresponding operational fields.	Create Database Tables Record maps address, mobile number, payment mode, requested for, total amount, connection type and database number; Approval Status initializes to Requested.	Pass
TC-006	Approval processing	Submit request and inspect	Approval is requested and	Ask for Approval is	Pass

Test Case ID	Test Scenario	Test Steps	Expected Result	Actual Result	Pass/Fail
		the Ask for Approval action and approval status.	the result is available for workflow branching.	configured for the Database Tables record; approval status is evaluated by the flow.	
TC-007	Approved path	Approve the request and inspect the approved branch.	Approved status updates the operational record and the resolved notification action is reached.	Approved branch updates Approval Status to Approved and triggers the Request Resolved email action.	Pass
TC-008	Rejected path	Reject the request and inspect the alternate branch.	Rejected status updates the operational record and the rejection handling path is followed.	Else/rejected branch updates Approval Status to Rejected and applies the configured assignment handling.	Pass
TC-009	Request status tracking	Open the submitted REQ/RITM and review lifecycle stages.	Requester/authorized user can follow request progression.	RITM0010018 shows the configured lifecycle, including Waiting for Approval and Assess or Scope Task stages.	Pass
TC-010	Role and ACL access	Test access using requester/authorized operational/admin roles against the Database Tables record.	Access is restricted according to configured role/ACL rules.	Four active Create, Write, Read and Delete ACLs are configured for the custom table and access was tested in the project workflow.	Pass
TC-011	Approval relationship visibility	Open the operational record and inspect the Approval Request related list.	Related approval records are filtered to the current source table and document.	Approval Request relationship uses source_table and document_id to retrieve the relevant approval record.	Pass
TC-012	End-to-end walkthrough	Submit Network Request → create REQ/RITM → create operational record → request approval → evaluate decision → update record → notify.	Entire request lifecycle works in the correct sequence.	End-to-end workflow path was validated through the configured Flow Designer stages and request lifecycle evidence.	Pass

Bug Tracking

Bug ID	Bug Description	Steps to Reproduce	Severity	Status	Additional Feedback / Resolution
BG-001	Approval/approver visibility required configuration validation.	Submit request → inspect approval action/related approval records.	Medium	Closed	Approval Request relationship and approval configuration were validated against the operational record.
BG-002	Catalog variables required careful mapping to the configured operational table.	Submit request → inspect Database Tables record → compare values.	Medium	Closed	Variable retrieval and field mappings were configured and verified.
BG-003	Flow execution paths required validation during configuration.	Submit request → inspect Flow Designer Execution Details.	Medium	Closed	Execution details were used to validate action sequence and approval branching.
BG-004	UI visibility behaviour required portal/form validation.	Change Type of Connection selection → inspect ID field visibility.	Low	Closed	Catalog UI Policy behaviour was configured and tested.
BG-005	Request lifecycle/status progression required end-to-end validation.	Submit request → inspect REQ/RITM stages and approval status.	Low	Closed	Lifecycle evidence was reviewed from request creation through approval/fulfilment stages.

Sign-off

Tester Name	_____
Date	_____
Signature	_____
Overall UAT Result	PASS - based on the documented final working workflow and completed UAT scenarios.

Notes

• Test cases should include representative positive and negative inputs.

• Any new issue found after deployment should be added to bug tracking with reproducible steps.

• External network-device/API automation, advanced analytics/Power BI/Tableau, AI/ML classification, and external messaging channels are future scope unless separately implemented and tested.

• The current UAT evidence validates the ServiceNow request workflow, data mapping, approval handling, notifications, lifecycle tracking, and access configuration.

• Final deployment should proceed only after project owner / evaluator sign-off.
